

Gear Manufacturing Capabilities

Precision machined gears for rotating assemblies and gearboxes — spur and helical gear manufacturing with complete shaft assembly capability.

Specifications

Gear Types	Spur Gears, Helical Gears
Outside Diameter	Custom (per drawing)
Module / Pitch	As specified
Quality Grade	DIN / AGMA standards
Profile Grinding	Available for high-precision requirements

Heat Treatment Options

- Case carburizing — deep hardened case for high-wear teeth
- Nitriding — surface hardening without distortion
- Induction hardening — localized hardening of tooth surfaces

Manufacturing Process

- CNC blank turning — gear blank preparation
- Gear hobbing — cutting the gear teeth profile
- Heat treatment — case hardening for wear resistance
- Bore and face grinding — mounting surface precision
- Profile grinding — final tooth geometry finishing (DIN 6 or better)

Materials

- Alloy Steels (EN353, 8620) — case hardening steels for high wear
- Carbon Steel (EN8 / EN9) — medium-strength low-speed gears
- Bronze — worm gears with low friction requirements

Value-Added Service

Gears can be assembled onto shafts in-house, providing a complete drop-in rotating assembly solution.
