

Material Test Certificate — Sample

This is a representative sample of the documentation package supplied with every precision machined component. Actual MTCs are issued per order with traceable heat numbers.

Certificate Contents

- Chemical composition analysis (spectrometric)
- Mechanical properties (tensile strength, yield strength, elongation, reduction of area)
- Heat treatment details and conditions
- Hardness test results (Rockwell / Brinell)

Compliance Standard

All Material Test Certificates conform to EN 10204 Type 3.1 — inspection documents issued by the manufacturer with specific test results on the supplied material.

Non-Destructive Testing

- DPT (Dye Penetrant Testing) — surface crack and porosity detection
- UT (Ultrasonic Testing) — internal defect detection
- PMI (Positive Material Identification) — alloy grade verification

Traceability

Every component is traceable from raw material heat number through to final dispatch. Heat numbers are stamped or engraved on the component and cross-referenced in the MTC.
